

Smoking and cancer

- The chemicals from smoking can poison the body and over time, can cause small lumps called **tumours** to grow anywhere in the body.
- These **tumours** can spread around the body and can make people very sick and eventually kill them.
- These tumours are called **cancer**.
- Many smokers die from **cancer**, especially lung **cancer**.
- Other types of **cancers** you may hear of are:
 - throat and mouth cancer
 - pancreas cancer
 - ovary and cervix cancer
 - stomach cancer
 - bone marrow cancer
 - cancer of the kidneys, liver, bladder and bowel
 - breast cancer.
- If you smoke you are more likely to get one or more of these cancers.

Chemicals from smoking can cause small lumps called **tumours** to grow anywhere in the body.

These **tumours** are called cancer and can spread around the body and make you very sick. They can even kill you.

Many smokers die from **cancer**, especially lung **cancer**.
